

Table 3. Survey of measurements on woodwinds

$d_1$  = inner diameter of main tube (mm).  
 $l_G$  = distance to tip of reed or to centre of embouchure-hole (mm).  
 $d_H$  = hole diameter or its smallest value (mm). For oval holes, smallest and largest values are given.  
 $l_H$  = minimum hole length (mm).  
 $h$  = mean distance of cup to hole end, in opened position (mm).

$R_o$  = radius of curvature of bended part of the bore.  
 + denotes undercutting of a hole.  
 = in the h-column, denotes that the hole is not covered by a key  
 - denotes no hole present.  
 ( ) tube diameters between brackets are estimates obtained via volume-measurements.

k) On soprano saxophones, the key mechanism is such that high B is formed with hole 8 closed, holes 16 and 17 being open. On the Selmer, besides that, the key on hole 18 is perforated with a hole of diameter 4 mm and length 6 mm, the last hole can be closed on low register by a second key hanging 4 mm above the perforated first key.
